Active Learning

Hackathon

Our Hackathons are interactive learning events where IT and development staff compete to find vulnerabilities in commercial-grade applications or defend an IT infrastructure in real-time. Participants become immediately immersed in a real-world environment where they learn, attack and defense is about thinking on your feet, creativity, and adaptability.

Instructor-led Training

We offer instructor-led Training over a wide range of topics ranging from general security awareness to core application security. We can help you achieve your certification goals by training you on certifications like CISSP, CEH, ISO 27001 LA/I etc. carried out by experienced trainers with several years of consulting and implementation experience across their relevant fields.

E-Learning Platform

Our Information Security Awareness program takes an interactive and engaging approach to help employees recognize the value of different types of sensitive information and drive the behavioural change needed to protect it. Our program is currently in use by over 200 organizations and is designed for general staff in roles such as human resources, legal, marketing, finance, sales, operations and customer service.

Passive Learning

Videos

We create customised training content in the form of 2D/3D videos; these security awareness videos can depict the daily workings of an organization and can be used to improve the understanding of information management throughout the organization.

Game-Based Learning

GBL is an interactive and effective way to build awareness of a company's policies and procedures without burdening the employees. GBL improves employee engagement levels and predominantly utilizes a delivery platform (smartphones, tablets, etc.) that finds favor with the employees than the mundane classroom sessions. Moreover, it provides a non-intrusive method to track and measure learning.

Digital Campaigns

We create highly effective digital campaigns that can be run across various platforms such as social media, emailers etc. Also our print campaigns have been successful in building a culture of cybersecurity awareness within various organizations.
